NSF CSSI Award: 2513101

Pegasus AI is an AI-driven scientific workflow management system that combines machine learning, large language models, online monitoring, and human guidance to support the workflow lifecycle. It helps scientists **create workflows, predict resource requirements, monitor execution, diagnose failures, and adapt execution plans**, making complex scientific workflows more efficient, resilient, and easier to manage.

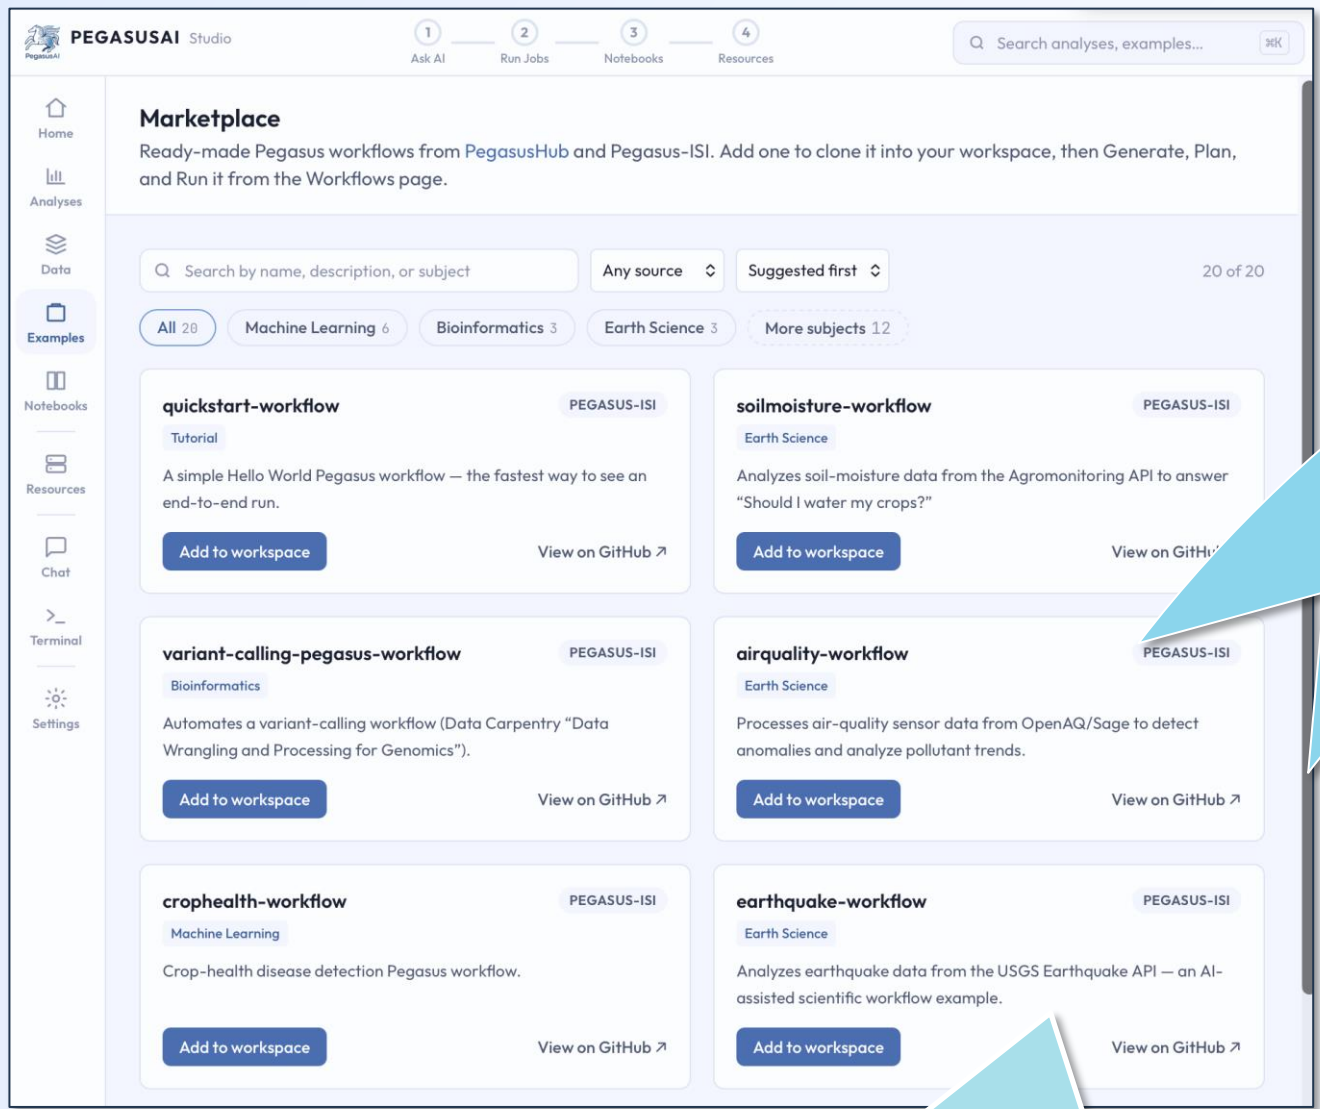

Pegasus AI Studio is an integrated environment that supports scientists across the workflow lifecycle, from defining research goals and generating Pegasus workflows with AI assistance to submitting them across computing resources, monitoring execution, diagnosing failures, and recommending corrective actions

* *Pegasus studio* : <https://studio.pegasus-ai.org>

Conversational AI Assistant

Supports workflow creation, answers Pegasus questions, explains execution results and assists with failure diagnosis.

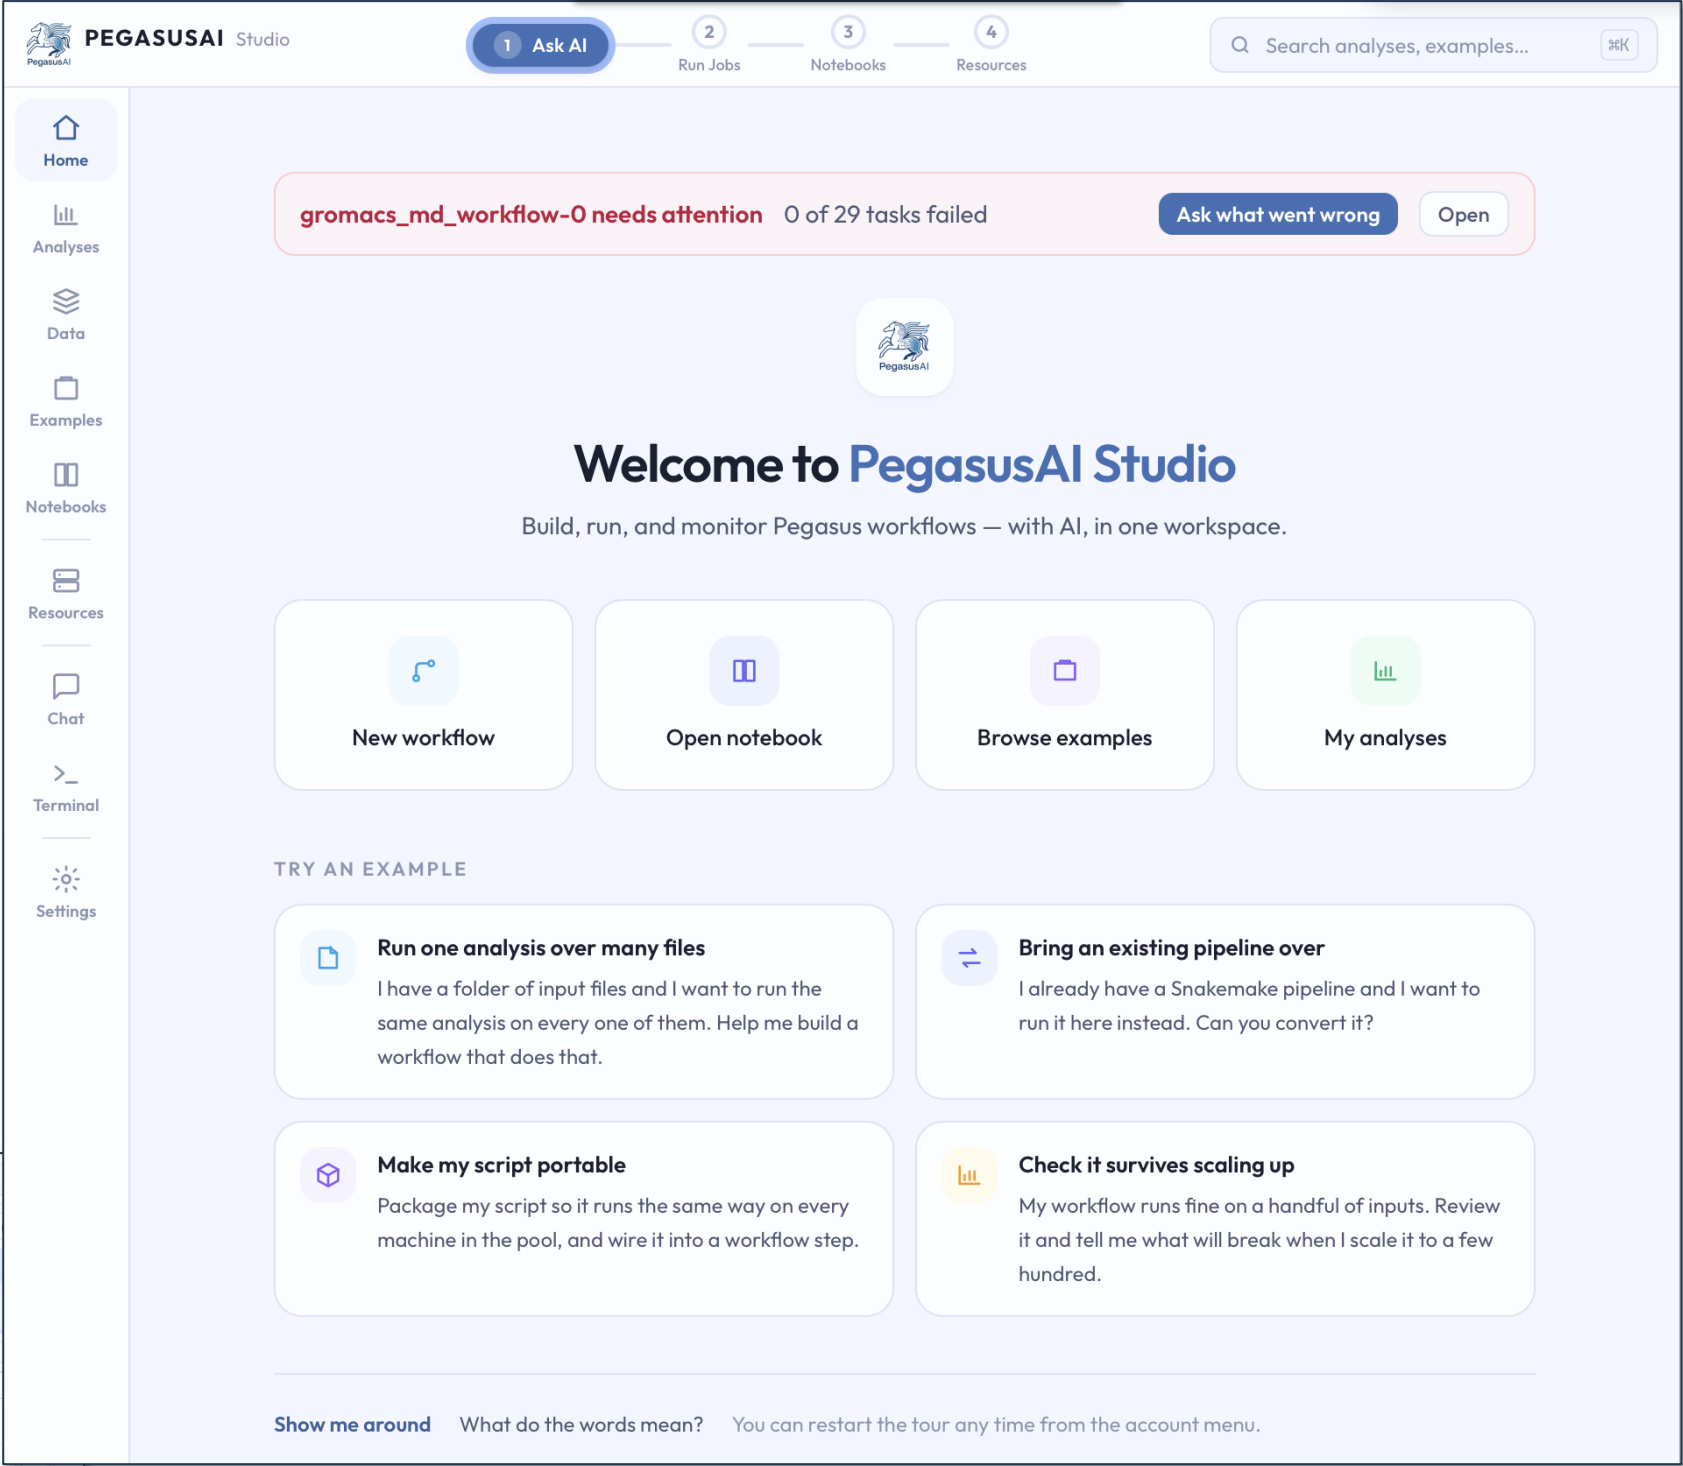

Create Workflow

Plan Workflow

Marketplace

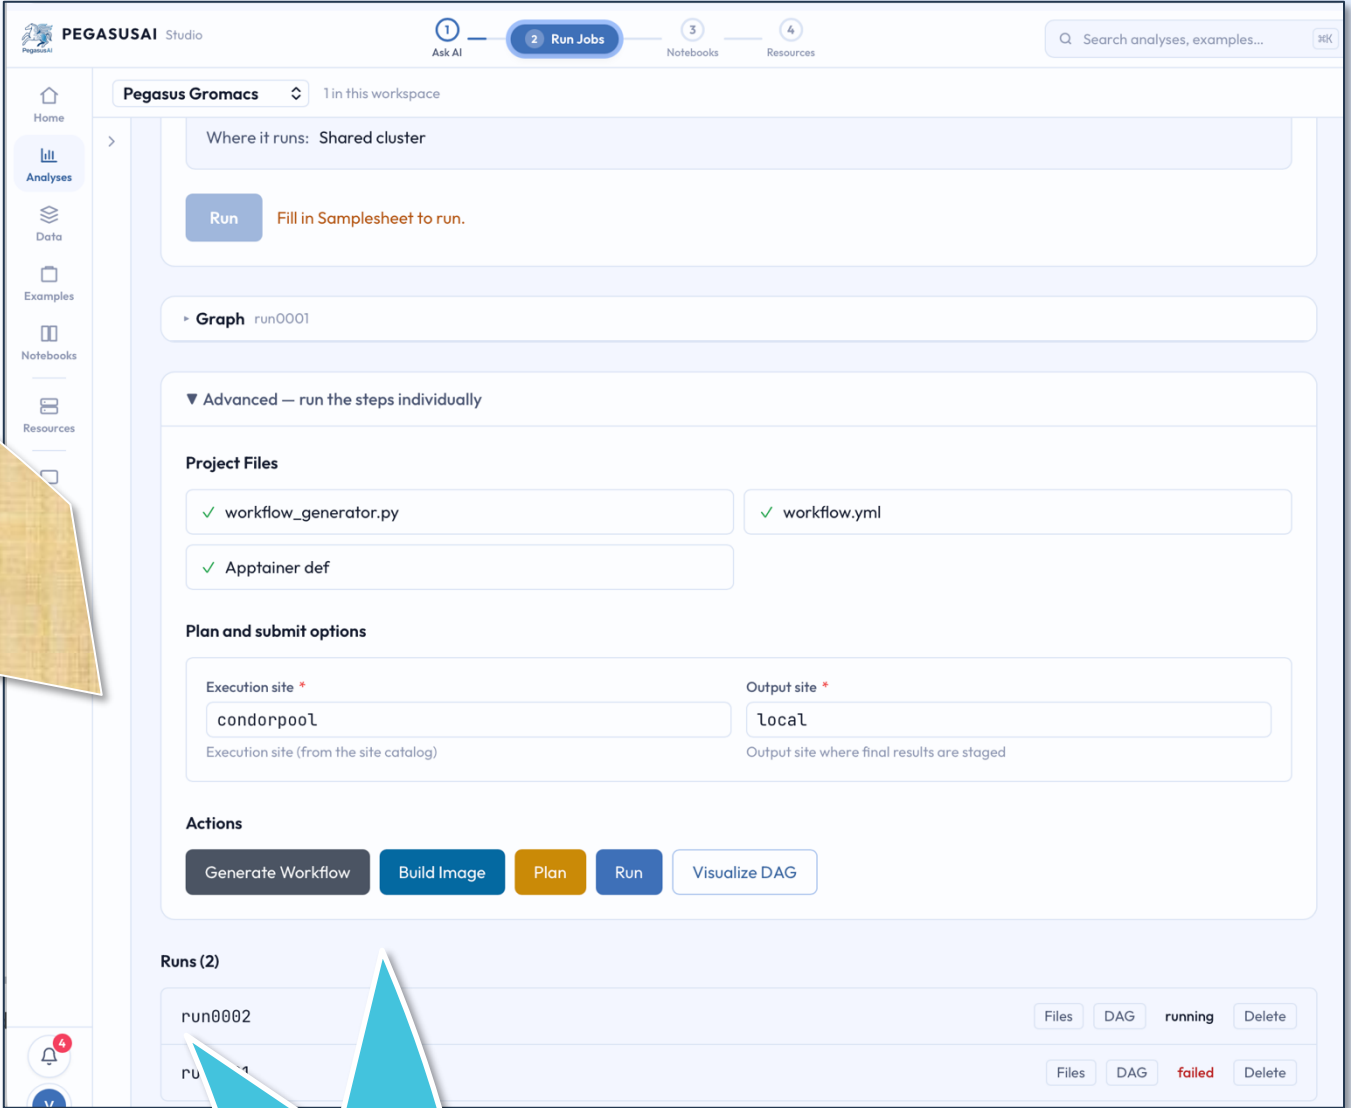

Explore curated workflows from different domains.

Explore Marketplace

Learn Workflows

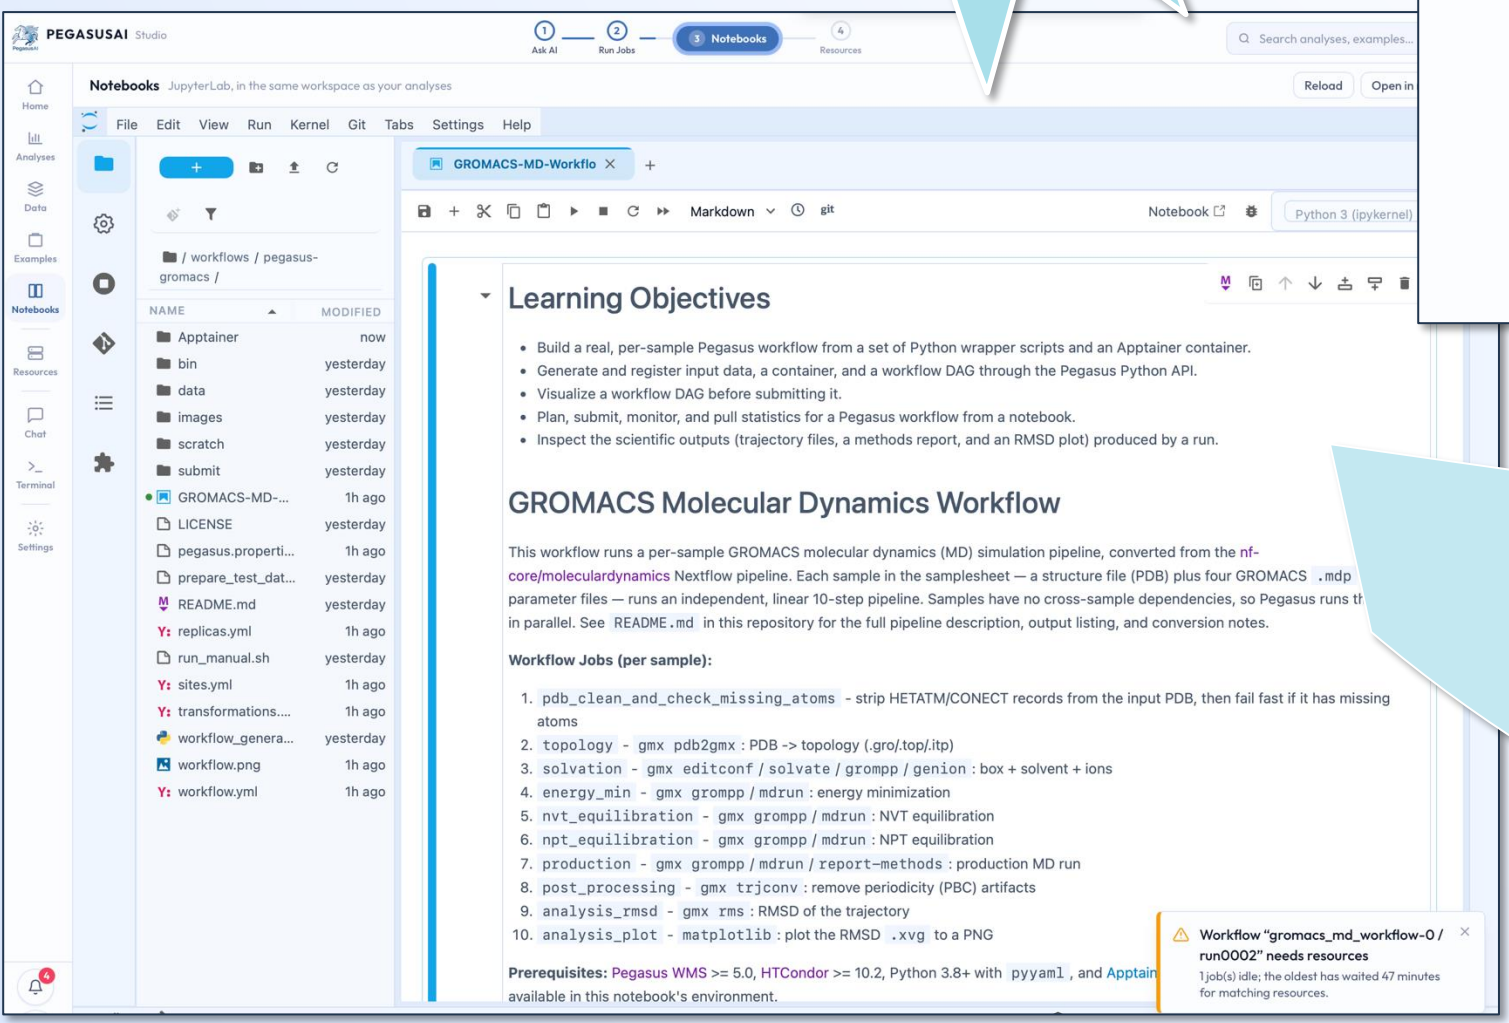

Monitor Workflows

Provision Resources

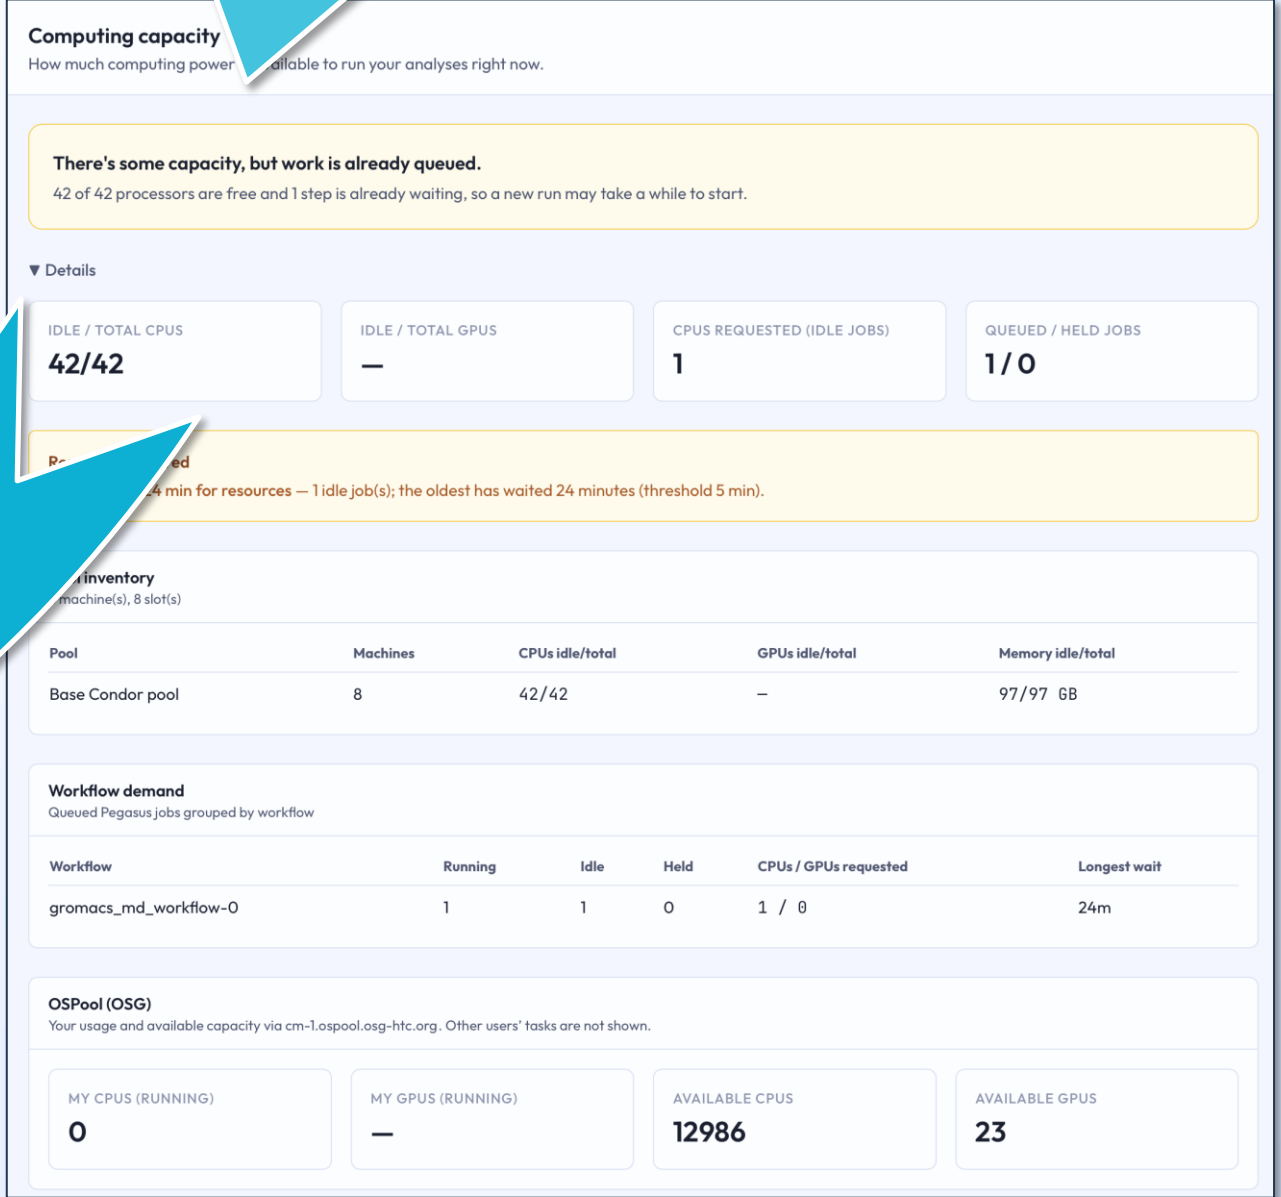

Distributed Computing

Decide what types of resources are needed, map workflow onto resource, bring resources from campus, cloud and national infrastructure.

Interactive Notebooks

Offers a browser-based environment for developing code, analyzing data and accessing workflow inputs and outputs.

Free Tier – Including AI Access

All users get free basic access to AI functionality, such as chatbot, OpenCode and debugging tools.

Power users can bring their own LLM or agents (Claude, Codex, ...).

Try it out!
